Please check out these two bimax simulations:

[attachment=232][attachment=233]

Both gifs have the same anterior advancement — measured by the length of the resulting posterior gap — but in one morph the maxilla is rotated counterclockwise with a corresponding impaction for a proper bite. There's obviously nothing wrong with the jaw in the before-images, but they're just morphs I made to get my bearings.

From the reading I've done there seems to be some aesthetic advantages — if you're a candidate — with a CCW rotation, e.g. improved mandible angle, less resulting mass at the base of the nose, a shorter lower third and a more curled, aesthetic philtrum (?).

Whenever I research my problems I keep bumping into posts by Kyra all over the web, which is understandable given that our issues are (were?) quite similar.

Am I understanding this right? Surgerycels please respond.

Decay

Is there dignity in living life as an entity?
Born into ruin, we feel withdrawal
Subhumanity is poison
And we are lost without a cure
We are not fit to walk amongst them
Eventually this is something we must accept
The world moves on without us
And only the grave welcomes us with open arms
So pray for your rebirth
Pray for another chance to bloom
While the rats will feed off of our failure
We wither away rotted from the core
Welcome to your new home

ccw: anterior maxilla/mandible up, posterior maxilla/mandible down

ah okay thank you

examples:

counterclockwise maxillomandibular advancement:

Quote:

Figure 6 - A counterclockwise maxillomandibular advancement (CCW-MMA) is depicted with pre surgery on the left and post surgery on the right. Note in the post surgical photograph the balanced profile without nasal problems associated with S-MMA.

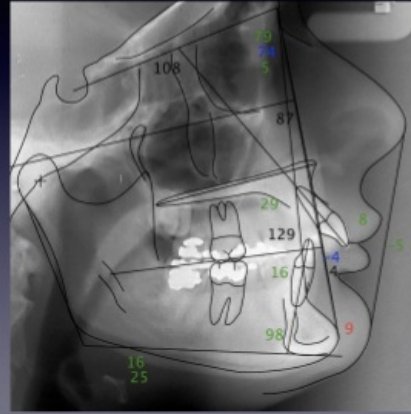

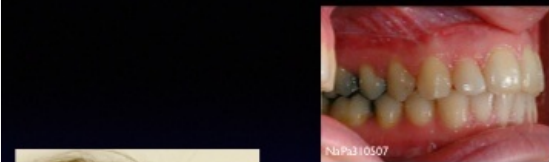

clockwise maxillomandibular advancement:

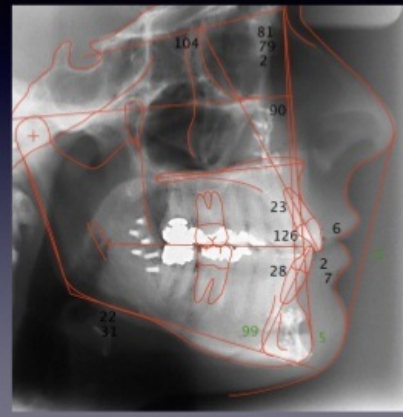

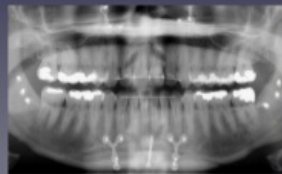

- Short face syndrome
- Hypodivergent

- When posturing in class I a posterior open bite is created
- This allow clockwise rotation of the distal segment when the BSSO is done
- This reduce slightly the advancement of the chin

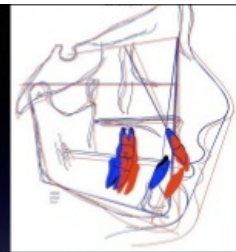

- Face height increased
- Class I relationship is achieved

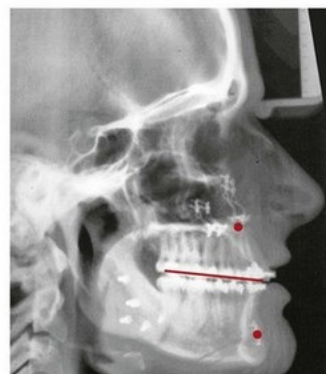

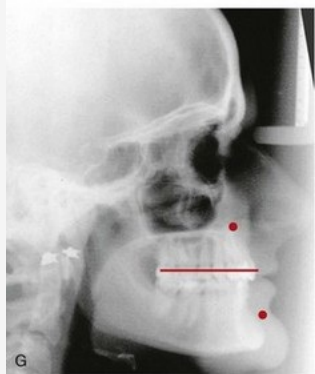

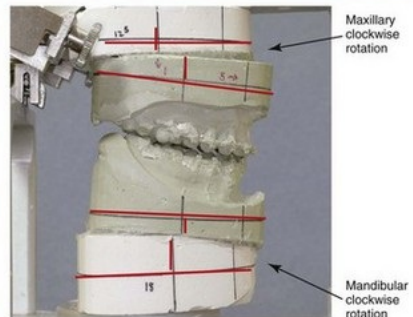

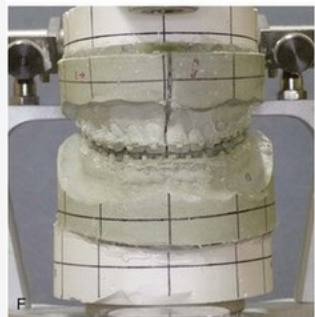

2 y Follow up

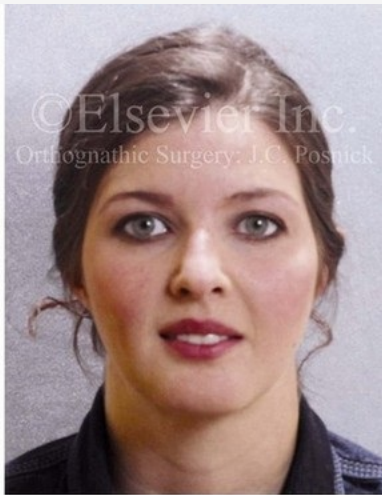

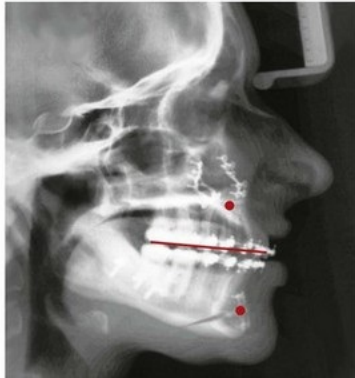

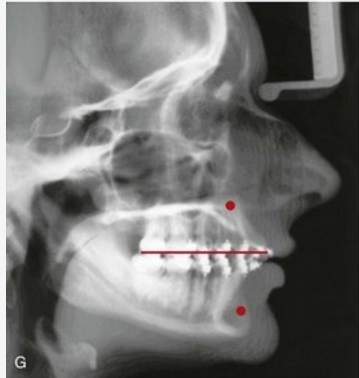

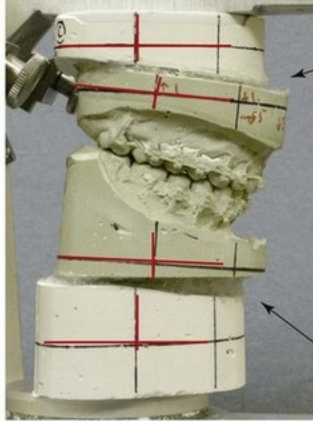

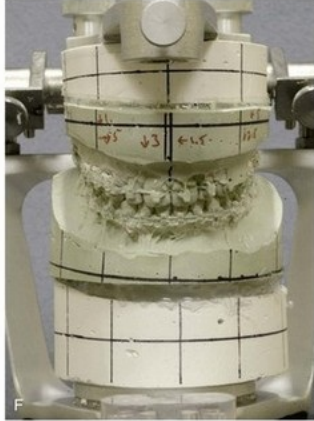

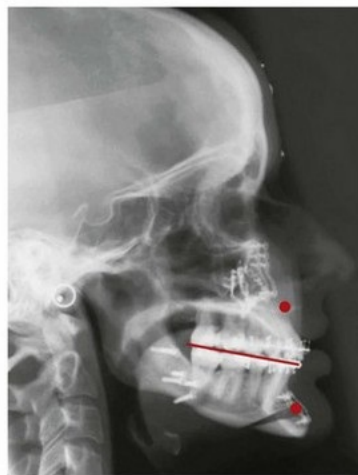

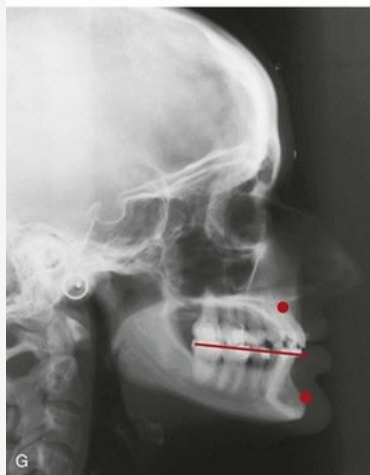

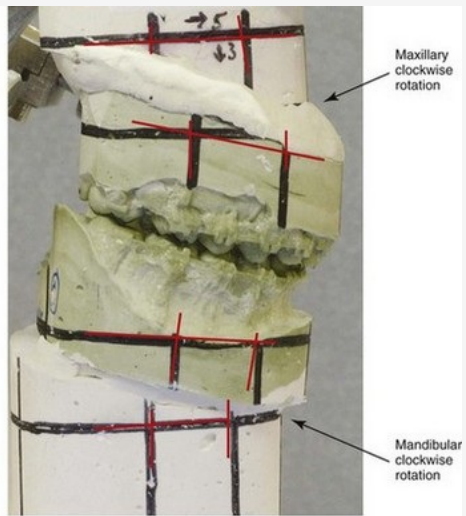

- Incisor display improved
- Self esteem improved

I'd sooner put a bullet through my face.

My outer appearance was poor, but in this way my inner world became richer than anyone else's. Was it not natural that a young boy who suffered from an indelible drawback like mine should have come to think that he was a secretly chosen being? I felt as though somewhere in this world a mission awaited me of which I myself still knew nothing.

You need a huge cock to even get them to remember you as anything but another *faceless cuckold*.

How does it feel that women remember being screwed by Chad's massive Coke can dong just as much as they remember the birth of their children, graduating college, and unwrapping their puppy on Christmas?

They remember Chad's cock when they're in the nursing home even if they forget the name of their own kids

Did this guy have other things done? Lipo? implants? How has his jawline improved so much? In the before he has none, and ater you can even see the jaw angle/ramus near his ear. I think I need this surgery...

Sailer charges an extortionate amount of money for procedures and he photoshops his before/ afters - confirmed by many forums.

Figure 42. Case 5 C.B. Pre-surgical: frontal view (d) profile view (e) and occlusion (f). Post-operative results: frontal view (g) profile view (h) and occlusion (i).

maybe good news for VME crew.

WTF???

so all they do is align the teeth and viola? no more long mid face?!?!?!?!?

I have a retruded chin tbh(it was natty small and it being retruded is worse)

My upper teeth are arched too(slightly) can this surgery be the problem solver?"?!?!?!?!!!!!!!

How is that so hard to understand? Read the caption. It says SURGERY. The height of the maxilla is reduced at the very least.
So in an extended way yes, it's that simple, you get surgery, and you go out with extremely optimized jaws. Your narrow upper teeth arch can be broadened by a *segmented* Lefort I.

Legit. this is what I'm getting except my maxilla is also slightly retruded.

the way impaction works is that the **bone behind the soft tissue (skin) is grown too vertically for the amount of soft tissue** there. that's why you kind of see this hollowness in the cheek region in the before picture. this hollowness is there because the **soft tissue is being stretched out(down) by the extra vertically grown bone behind** it. in a lefort 1 impaction, the bottom portion of the maxilla is detached from the skull and a **slither of bone is removed** and the surgeon can either rotate CCW or keep the plane in which the teeth rest at, depending on the soft tissue profile of the patient. this **extra vertical bone growth** in the maxilla is also why she cannot close her lips **at rest** before (without straining which would also affect chin aesthetics). in addition, removing a sliver of the maxilla will **also affect the aesthetics of the lower jaw**; when the **maxilla rises, so do the teeth attached to it**. This alleviates "long face syndrome" (where the **lower jaw is locked in a clockwise rotation by the teeth** because of the extra downward growth in the maxilla) by letting the **lower jaw auto rotate in to a higher and more forward position (by meeting into a new higher position of the teeth in the maxilla)**. overall, you can see in the before and after that its as if her whole bottom third rotated counterclockwise, up and forward.

tldr: bone = hand
soft tissue/skin = glove

hand fits into glove badly because it is too big/small. impaction makes sure the proportions of the hand are adjusted so that it is the perfect fit for the glove

Wow, from a facial structure point of view.....these results are amazing....I mean....I personally wouldnt do it because I'm not loaded with money and I don't really need it; but it's creating such a good look and foundation....Tbh though...most people could achieve the same result with just sliding genio...there is always an exception though.....I'm actually kinda curious....what really is shocking me is that all these people....look at their cheeks in the before and after photos, the have significant reduction of how much their cheeks pop out when they smile....makes them look so much better....and that part of the cheek is the upper part that can't be removed by surgery....as far as I know??

it depends on your facial structure and midface length, but you're seeing this because people with shorter midfaces(more forward grown) tend to have a maxilla that fits in between the cheekbones. this picture of david gandy is a good way to explain this if it is hard for you to visualize what I'm saying:

the **bottom blue lines is where gandys cheekbones end**, and the **red lines illustrate roughly where his maxilla sits**. since his **maxilla fits "inbetween" his cheekbones it stretches the skin in the green part forward**, given that the maxilla is not retruded and forward grown and sits at a high angle. the good news is

that this part of the maxilla is accessible on jaw surgery patients via the lefort 1, 2/3

I theorize that this is the most important component of having good facial harmony, given that everything else is ok / excellent. I believe this because having a well grown maxilla/lower jaw allows a "base" for people to accurately assess the overall picture/features as it provides a comfortable forward "**focal point**" for the viewer to trace his eyes back to **while evaluating the rest of the face**. people with **well defined philtrums + jaws support are the perfect example of this** as the eye would shift its gaze from the eyes to the prominent philtrum back to the eyes and maybe surrounding areas like cheekbones, lower jaw, chin etc back to the forward philtrum.
